

# You build the best space tech on the planet!

Without permits, it's staying on the planet.

The bottleneck is not your engineering, and it's not launch cadence. It's paperwork. Every mission faces a unique tangled web of jurisdiction—and mission-specific permits, agencies, and requirements.

Compliance is not just complex, it is the silent killer of space missions.

We've seen missions stall for months or years, not because the tech failed, but because the paperwork did.

Most companies underestimate it. Then they hit a wall.

When they do, timelines collapse, costs explode, and investor confidence vanishes.

*What if that never had to happen?*

- ⚡ **Save your time, your money, and your sanity**
- ⚡ **Remove the regulatory unknowns derailing your mission**
- ⚡ **Get submission-ready workflows from mission data**
- ⚡ **Know exactly what is needed, by when, and for whom**
- ⚡ **Reduce rework, delays, and dependency on external consultants**

**BLUE  
DWARF**

Focus on your launch. We'll take care of the compliance burden

# The unspoken problem at the heart of every space company

You built something incredible. You have propulsion, payload, and a path to orbit, however regulatory workflows are not just slowing you down, they are threatening to stall your mission altogether. What starts as a few forms quickly becomes a tangled web of permits, obligations, and jurisdiction-specific approvals, each with its own dependencies and priorities. It only takes one overlooked detail to delay an entire mission, and when it does, the timeline slips, costs climb, and investor confidence wavers.

## Everyone thinks they've got it

Even the most capable teams can be caught off-guard by the unfathomable and hidden complexity of compliance workflows.

We've heard the same story over and over: "We thought we had time."

"We thought we had it covered."

"We didn't know how hard it would be."

## We built Blue Dwarf for You

Our platform turns your mission parameters into submission-ready, regulator-aligned workflows that reflect real-world complexity. We work ahead of the curve, removing ambiguity, building jurisdiction-specific documentation, and mapping global requirements into unified, repeatable processes. What used to take teams hundreds of hours, we convert into structured data entry.

## We work the entire mission stack

From payload to return, and from debris mitigation to frequency licensing and environmental approvals, we reduce risk before it hits. We ensure everything is in place before it is needed, with workflows and documentation aligned to the jurisdictions you operate in, and the ones you need access to.

## Designed by those who have lived it

Our team includes legal, regulatory, and mission operations experts, as well as engineers, policy leaders, defence advisors, and internationally recognised specialists who have designed space systems and written the regulations they are governed by. We've been on the other side of this pain and built the system we wish we had.

**You only build trust once. Let Blue Dwarf protect it.**

Space compliance. Simplified.
